43. **SEA LEVEL** Florida is on average 100 feet above sea level. This level varies by as much as 245 feet depending on precipitation and your location. Write and solve an equation describing the maximum and minimum sea levels for Florida. Is this solution reasonable? Explain.

ANSWER:

$|x - 100| = 245$; maximum: 345 ft above sea level; minimum: -145 ft below sea level. No, the maximum is reasonable but the minimum is not. Florida's lowest point should be at sea level where Florida meets the Atlantic Ocean and the Gulf of Mexico.

45. **CRITIQUE** Ana and Ling are solving $|3x + 14| = -6x$. Is either of them correct? Explain your reasoning.

<p><i>Ana</i></p> $ 3x + 14 = -6x$ $3x + 14 = -6x \text{ or } 3x + 14 = 6x$ $9x = -14 \qquad 14 = 3x$ $x = \frac{-14}{9} \quad \checkmark \qquad x = \frac{14}{3} \quad \checkmark$	<p><i>Ling</i></p> $ 3x + 14 = -6x$ $3x + 14 = -6x \text{ or } 3x + 14 = 6x$ $9x = -14 \qquad 14 = 3x$ $x = \frac{-14}{9} \quad \checkmark \qquad x = \frac{14}{3} \quad \times$
--	---

ANSWER:

Ling; Ana included an extraneous solution. She would have caught this error if she had checked to see if her answers were correct by substituting the values into the original equation.

46. **CHALLENGE** Solve $|2x - 1| + 3 = |5 - x|$. List all cases and resulting equations. (*Hint:* There are four possible cases to examine as potential solutions.)

ANSWER:

The 4 potential solutions are:

- $(2x - 1) \geq 0$ and $(5 - x) \geq 0$
- $(2x - 1) \geq 0$ and $(5 - x) < 0$
- $(2x - 1) < 0$ and $(5 - x) \geq 0$
- $(2x - 1) < 0$ and $(5 - x) < 0$

The resulting equations corresponding to these cases are:

- $2x - 1 + 3 = 5 - x : x = 1$
- $2x - 1 + 3 = x - 5 : x = -7$
- $1 - 2x + 3 = 5 - x : x = -1$
- $1 - 2x + 3 = x - 5 : x = 3$

The solutions from case 1 and case 3 work. The others are extraneous. The solution set is $\{-1, 1\}$.

REASONING If a , x , and y are real numbers, determine whether each statement is *sometimes*, *always*, or *never* true. Explain your reasoning.

47. If $|a| > 7$, then $|a + 3| > 10$.

ANSWER:

Sometimes; this is only true for certain values of a . For example, it is true for $a = 8$; if $8 > 7$, then $11 > 10$. However it is not true for $a = -8$; if $8 > 7$, then $5 \not> 10$.

1-4 Solving Absolute Value Equations

48. If $|x| < 3$, then $|x| + 3 > 0$.

ANSWER:

Always; if $|x| < 3$, then x is between -3 or 3 .

Adding 3 to the absolute value of any of the numbers in this set will produce a positive number.

49. If y is between 1 and 5, then $|y - 3| \leq 2$.

ANSWER:

Always; starting with numbers between 1 and 5 and subtracting 3 will produce numbers between -2 and 2 . These all have an absolute value less than or equal to 2.

50. **OPEN ENDED** Write an absolute value equation of the form $|ax + b| = cx + d$ that has no solution.

Assume that a , b , c , and $d \neq 0$.

ANSWER:

Sample answer: $|2x + 1| = x - 3$, or

$$|3x + 10| = x - 5, \text{ or } |x - 1| = \frac{1}{2}x - 4$$

51. **WRITING IN MATH** How are symbols used to represent mathematical ideas? Use an example to justify your reasoning.

ANSWER:

Sample answer: Symbols can be used as a shorthand way to represent ideas such as operations, equality, absolute value, and the empty set. For example, instead of writing 5 minus the absolute value of $2x$ equals 10, you could write $5 - |2x| = 10$.
